Assignment Instructions: Module 9 - Goal Programming

Purpose

The purpose of this assignment is to explore goal programming formulations and solutions. In addition, this will help you master the following module outcomes:

- Formulate and model multi-objective models.
- Categorize the type and importance of goals.

Directions

The Research and Development Division of the Emax Corporation has developed three new products. A decision now needs to be made on which mix of these products should be produced. Management wants primary consideration given to three factors: total profit, stability in the workforce, and achieving an increase in the company's earnings next year from the \$75 million achieved this year. In particular, using the units given in the following table, they want to

Maximize Z = P - 6C - 3D, where

P = total (discounted) profit over the life of the new products,

C = change (in either direction) in the current level of employment,

D = decrease (if any) in next year's earnings from the current year's level.

The amount of any increase in earnings does not enter into Z, because management is concerned primarily with just achieving some increase to keep the stockholders happy. (It has mixed feelings about a large increase that then would be difficult to surpass in subsequent years.)

The impact of each of the new products (per unit rate of production) on each of these factors is shown in the following table:

| | Unit Contribution Product: | | | | |
|----------------------------|----------------------------------|----|----|----------|------------------------------------|
| | | | | | |
| Factor | 1 | 2 | 3 | Goal | Units |
| Total profit Employment | 20 | 15 | 25 | Maximize | Millions of dollars Hundreds of |
| level | 6 | 4 | 5 | = 50 | employees |
| Earnings next year | 8 | 7 | 5 | ≥ 75 | Millions of dollars |

Questions

1. Define y_1^+ and y_1^- , respectively, as the amount over (if any) and the amount under (if any) the employment level goal. Define y_2^+ and y_2^- in the same way for the goal regarding

earnings next year. Define x_1 , x_2 , and x_3 as the production rates of Products 1, 2, and 3, respectively. With these definitions, use the goal programming technique to express y_1^+ , y_1^- , y_2^+ and y_2^- algebraically in terms of x_1 , x_2 , and x_3 . Also express P in terms of x_1 , x_2 , and x_3 .

- 2. Express management's objective function in terms of x_1 , x_2 , x_3 , y_1^+ , y_1^- , y_2^+ and y_2^- .
- 3. Formulate and solve the linear programming model. What are your findings?

Requirements

All due dates are included in the Assignment Schedule.

General Submission Instructions

All work must be your own. Copying other people's work or from the Internet is a form of plagiarism and will be prosecuted as such.

Upload an R markdown file, along with any required .lp files to your git repository. Name your file Username_#.ext, where Username is your Kent State User ID (the part before @), and # is the Assignment number.

Provide the link to your git repository in Blackboard Learn for the assignment.
